```

Software issue:
The issue is a mismatched loss function and metric for a classification task. The model uses softmax output and one-hot encoded labels, which is multi-class classification. However, it is compiled with ‘mse’ and ‘mae’, regression metrics. The correct loss should be categorical_crossentropy and the correct metric is categorical_accuracy.

I also fixed the cells below.
METRIC_TO_PLOT = "categorical_accuracy" for the consistency.
